

Instructions for thicket-condition labellers

The coordinator will send you one personal assignment link. It looks like:

```
https://geethen.github.io/ThicketCondition/?assignment=GS
```

Use that exact link every time. Your assignment code is not a password, but it selects your point list, so do not remove or change the `?assignment=...` part.

Before starting

1. Open your personal link in a normal browser window, not private/incognito mode.
2. Check the blue assignment box. It must show the campaign, your assignment code, and the number of points you were given. If it says "Coordinator mode" or reports an unknown assignment, stop and contact the coordinator.
3. Enter your name or initials. Use the same name throughout the campaign.

Labelling

1. Read the field guidance at the top before beginning.
2. Judge the centre of the sample point using more than one imagery source or Wayback date when the interpretation is unclear.
3. Choose one class. Use **Unsure**, a note, and a review flag when the imagery does not support a defensible decision; do not guess.
4. Your progress is saved automatically in this browser. Prefer to continue on the same device and browser.

Some points are intentionally assigned to two people. This is blind QA, not a mistake. Do not compare labels with another labeller until the coordinator has closed the campaign.

Backups and submission

1. At the end of every work session, select **Review & download**.
2. Choose **JSON (full fidelity)** and download a backup, even if the assignment is incomplete.
3. Keep your latest backup. To resume on another device, open your same personal link and use **Upload / resume**.
4. When finished, download the final JSON and send it to the coordinator using the agreed file-sharing method. Do not rename the file unless asked.

The app is not connected to a central server. Closing the browser does not send your work to the coordinator; the downloaded final file is your submission.
